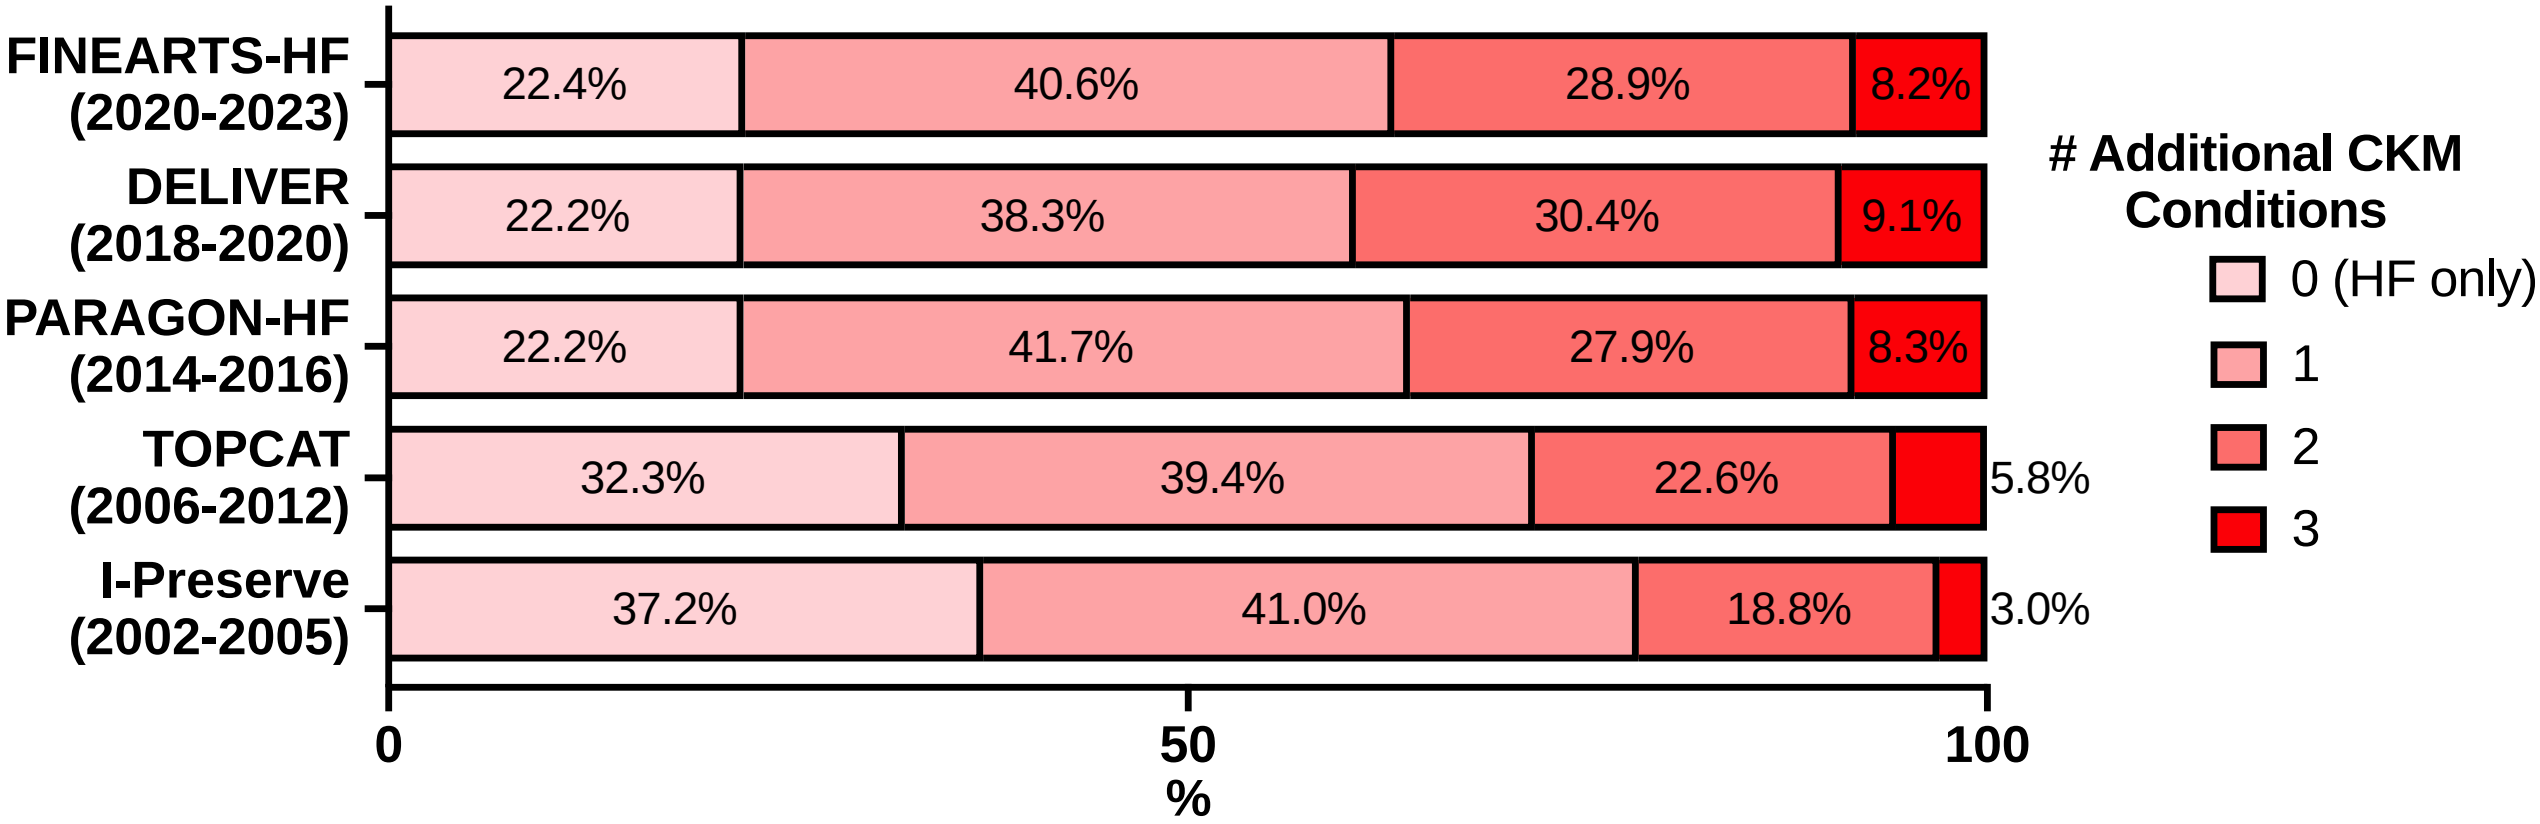
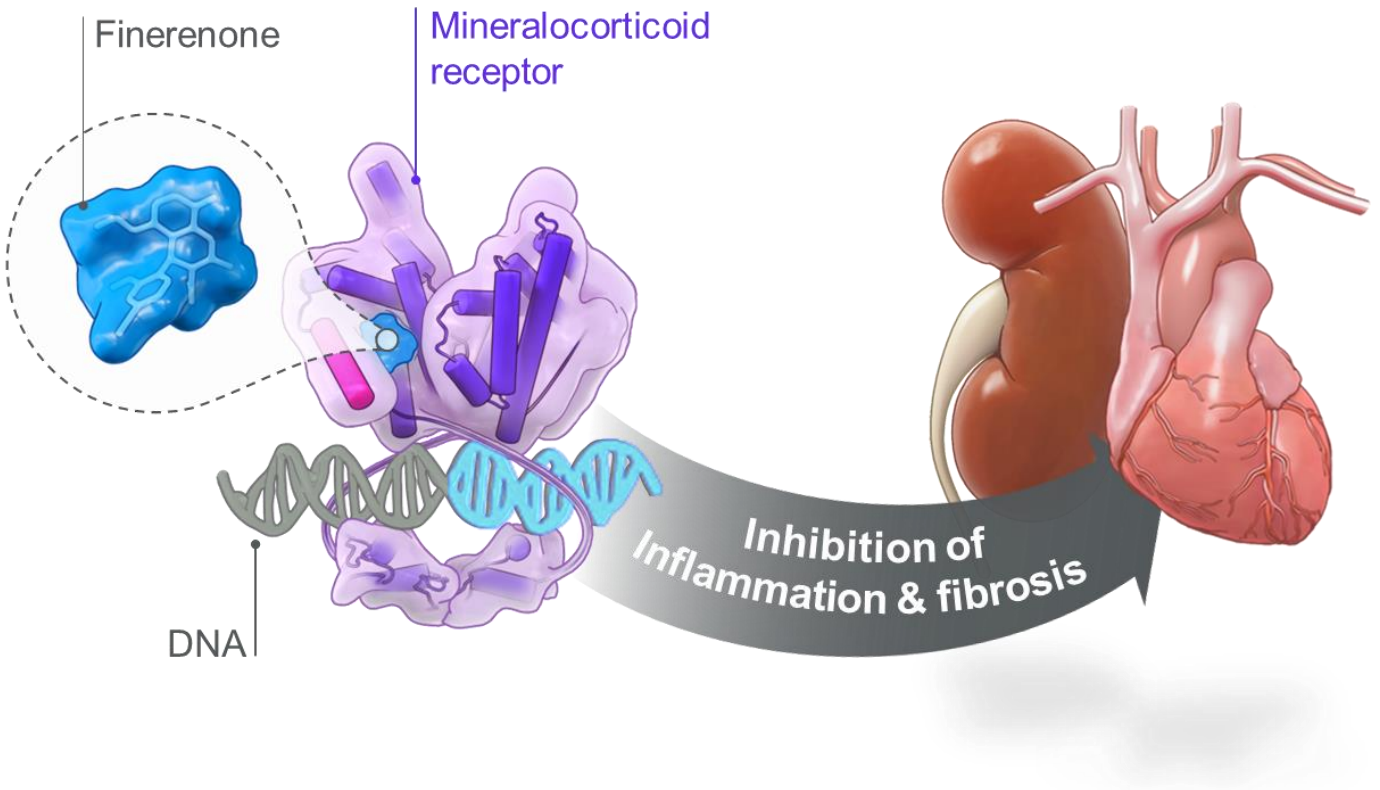
Increasing CKM Overlap in Trials of HFmrEF or HFpEF Over Time



Ostrominski JW…Vaduganathan M. JACC 2024

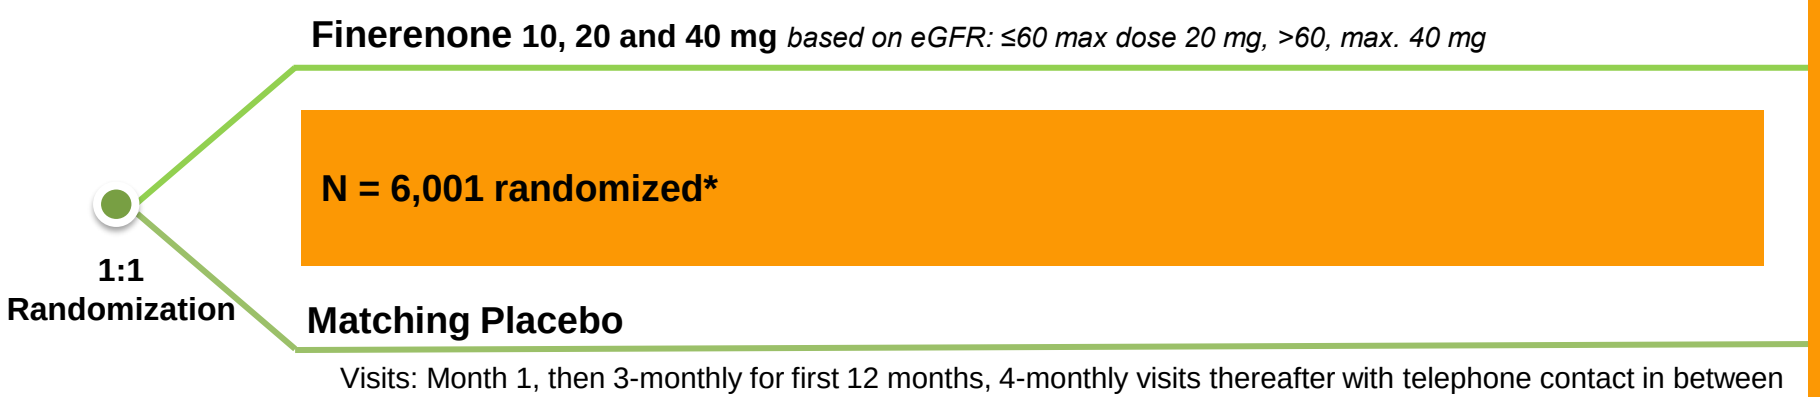
Could the Non-Steroidal MRA, Finerenone, Modify Risk across the CKM Spectrum?

- **Finerenone is a non-steroidal MRA that has been studied in RCTs of patients with T2D and CKD and separately in patients with HF (with and without T2D)**
- **However, none of these trials were individually powered to evaluate treatment effects on cardiovascular mortality**



Design of the FINEARTS-HF Trial

FINEARTS-HF was designed to evaluate the efficacy and safety of finerenone in patients with HF and LVEF ≥40%, with or without diabetes, and across a broad range of renal function



Study Endpoints

Primary Endpoint

- **CV death and total HF events (hospitalizations/urgent visits)**

Secondary Endpoints

- Total HF events
- NYHA class at 12 months
- KCCQ-TSS at 6,9, &12 months
- Renal composite endpoint
- All-cause mortality

Key Inclusion Criteria

- Symptomatic HF (NYHA class II-V) with LVEF ≥ 40%
  - *LVEF ≥ 60% capped at 20%*
- Hospitalized, Recently Hospitalized, or Ambulatory
- Elevated Natriuretic Peptide Levels (300/900 AF)
- Structural Heart Disease (LA Enlargement or LVH)
- Diuretics in the 30d prior to randomization

Key Exclusion Criteria

- Potassium > 5.0 mmol/L; eGFR <25 mL/min/1.73 m²
- MRA use 30d prior to randomization
- MI or PCI 30d prior to randomization
- Cardiogenic shock
- History of dilated, peripartum, chemotherapy induced, or infiltrative cardiomyopathy (e.g., amyloidosis)
- Alternative causes of signs or symptoms
